Models of Provider Choice

(1)

$$(PRO_j | AE)_i = 1, \text{ if } p_i^* > 0 \quad j=1, \dots, 5$$

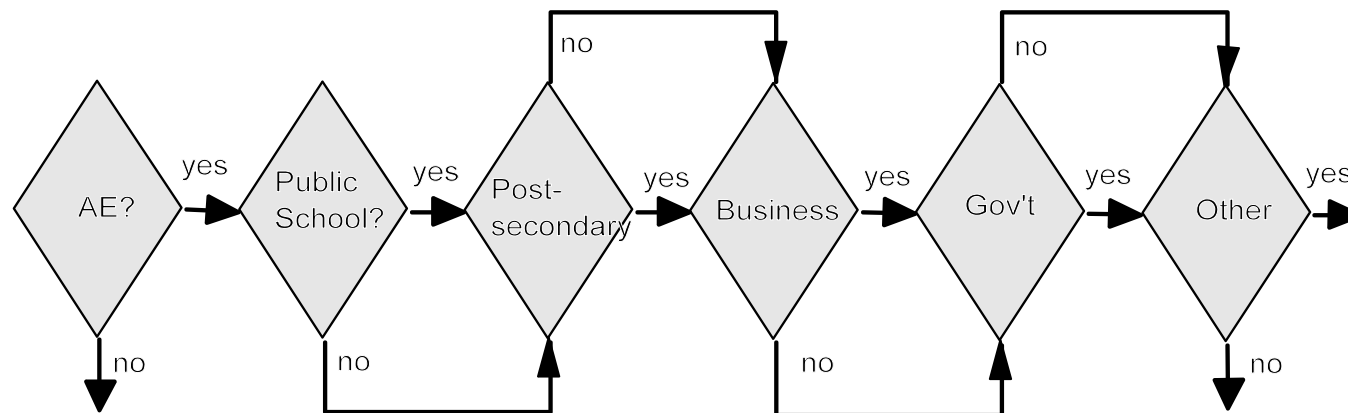

$$= 0, \text{ otherwise}$$

$$p_i^* = a_j + B_j X_i + u_{ij}$$

$(PRO_j | AE)_i$ = 1 if individual i reported participating in an adult education course provided by provider type j ; $j=1, \dots, 5$
 0, otherwise

p_i^* = (unobserved) indicator variable or probit for individual i
 X_i = vector of characteristics describing individual i thought to be related to provider choice

a_j, B_j = parameters to be estimated
 u_{ij} = standard error terms

Models of Provider Choice (Continued)

$$(2) \quad (PRO_j | AE)_i = j \quad \text{if } C_{j-1} < p_i^* \leq C_j \quad j=1, \dots, 5$$

$$p_i^* = a_j + B_j X_i + u_i$$

where

$$0 \leq C_j \leq 1; C_0 = 0; C_5 = 1$$

C_j = cumulative probability that individual i will choose provider type k ; $k \leq j$

Model of Earnings Payoff to Provider Type

$$(3) \quad \ln E_i = a + B'X_i + C'AE_i + D(PRO_j)_i + e_i$$

where E_i = annual earnings of individual i

X_i = vector of characteristics describing i
that are related to earnings

AE_i = scalar or vector of adult education
participation characteristics of
individual i

PRO_j = 1 if individual i participated in an adult
education course provided by provider
type j ; $j=1, \dots, 5$

a, B, C, D = parameters to be estimated

e_i = standard error term

Source: Estimated from observations with annual earnings in the 1995 National Household Education Survey. Sample size is 6,415.

Note: Table entries are coefficient estimates from weighted least squares regression of the log of annual earnings. Besides variables in the table, the independent variables included minority status, marital status, presence of children < 18, South Census region, home ownership status, MSA residence, years of education, a quartic in age, full-time student status, and part-time student status.
